

THE CROP CAPSULES COMPANY

Beneficial insect mass-release systems

Proprietary capsule and spreading system for mass-releasing beneficial parasitic wasps into a range of crops

KEY BENEFITS

Capsule design promotes insect health, survival and reproductive activity

Quickly and evenly applied using light aircraft fitted with precision placement technology

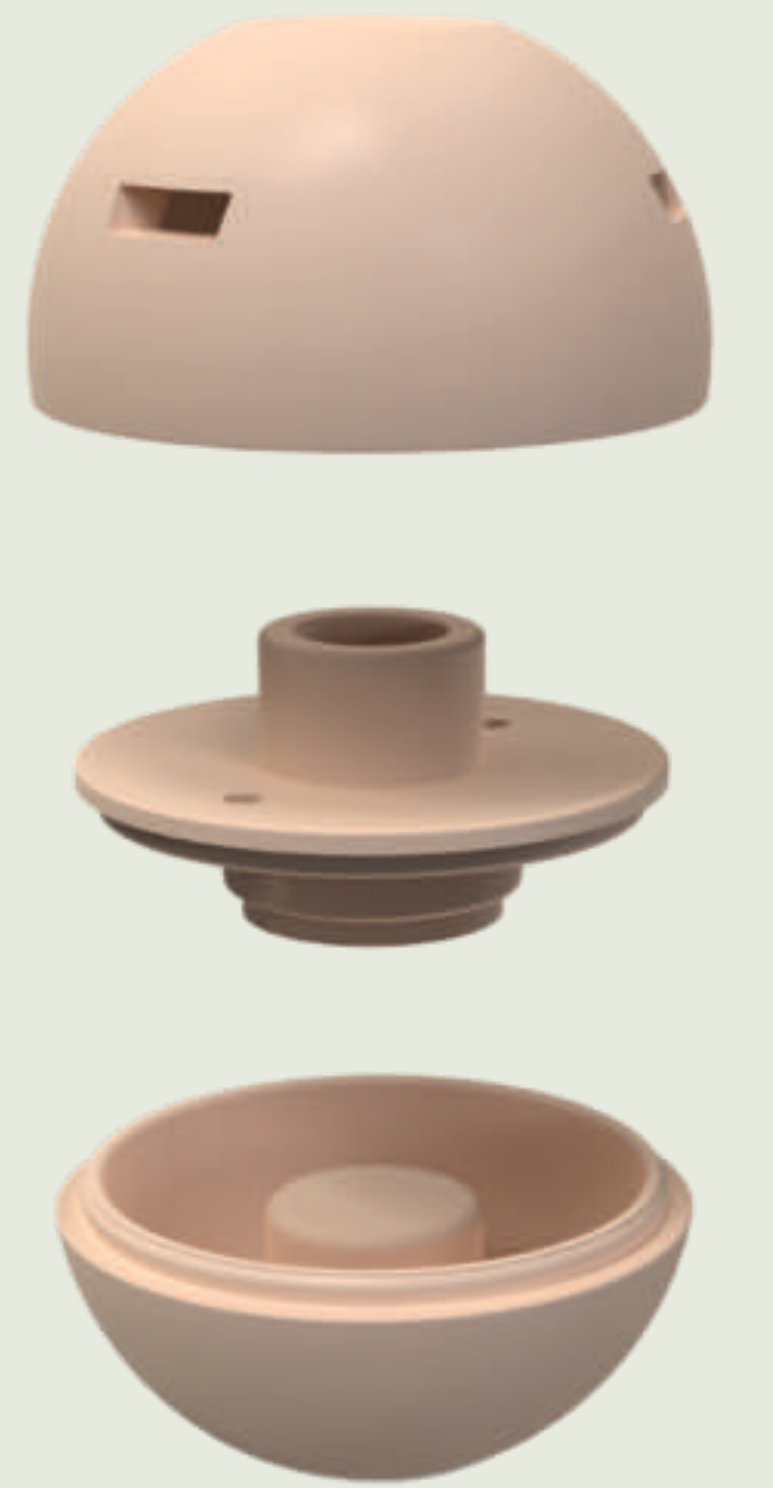

Capsules made entirely from renewables. Biodegradable and compostable

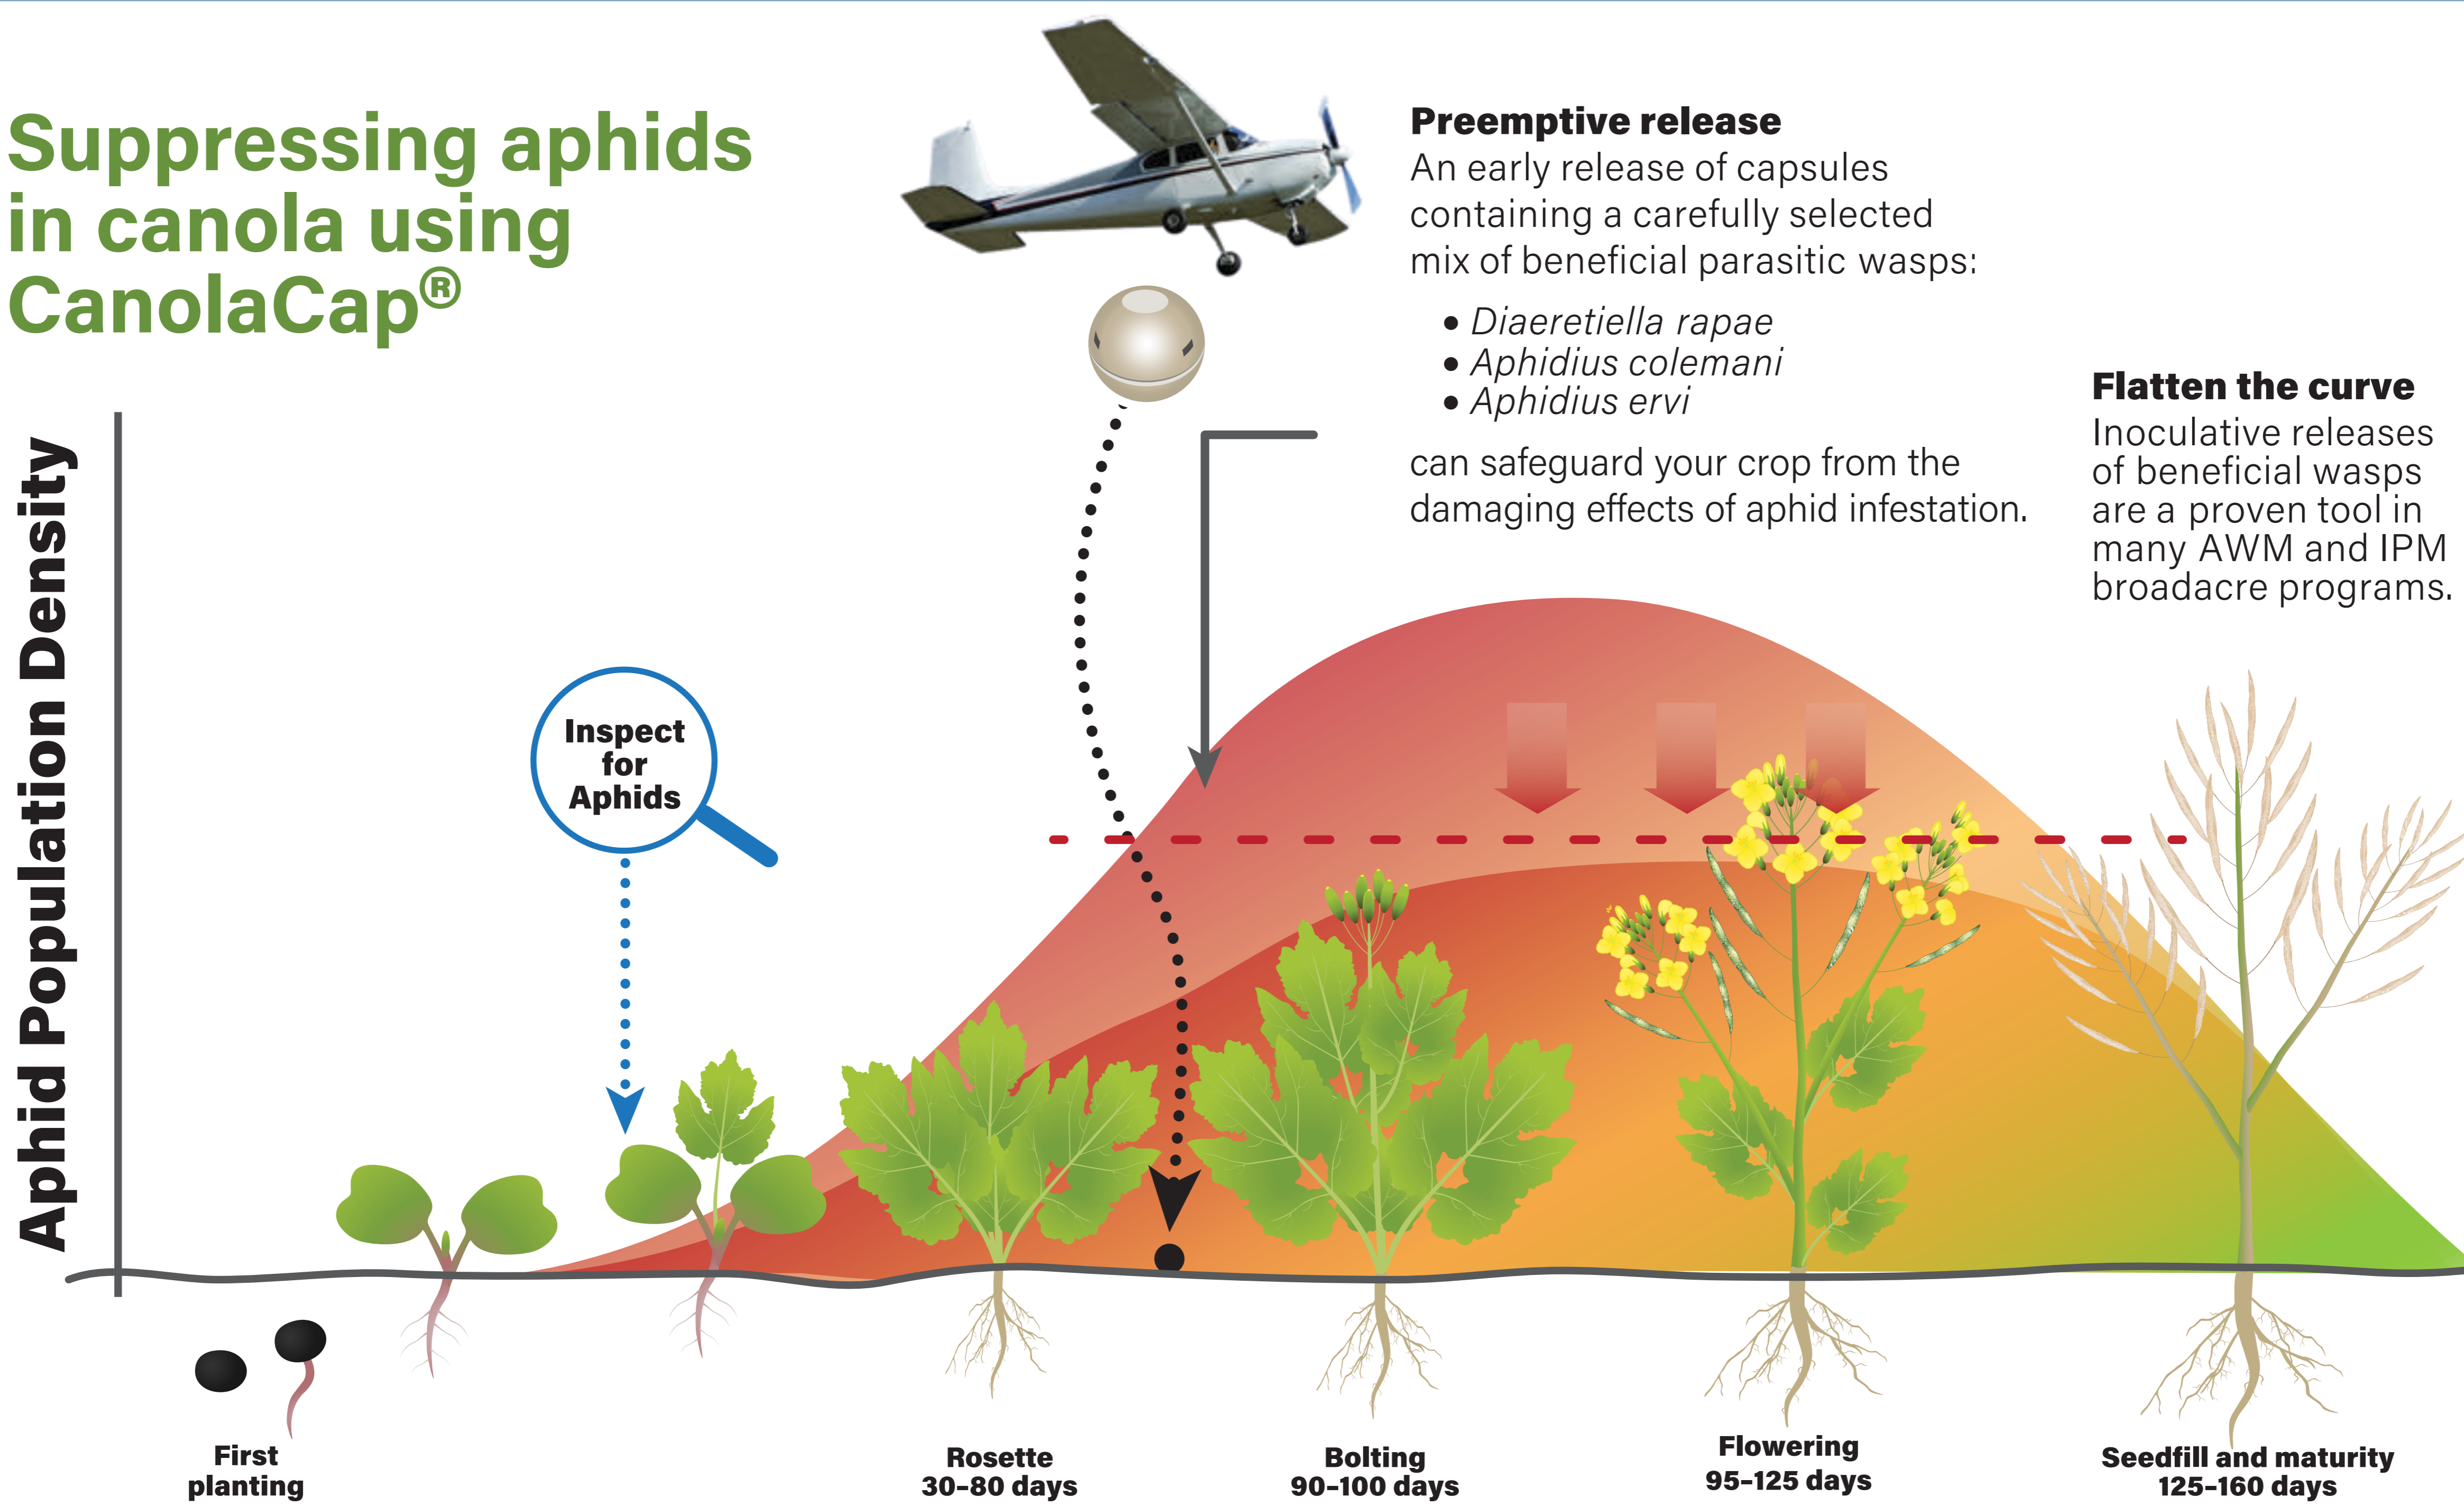

Cap slots promote a positive phototactic response from hatched and emerging insects. The light encourages parasitoids to mate and move into the crop

A **septum** seals the capsule making a virtually water-tight chamber with just the right number and sized holes for air exchange, light entry and hatched wasps to exit the capsule

An insulating and **weighted base** houses delicate, live wasp eggs or pupae. Perimeter weighting ensures the capsules drop and land in the right orientation

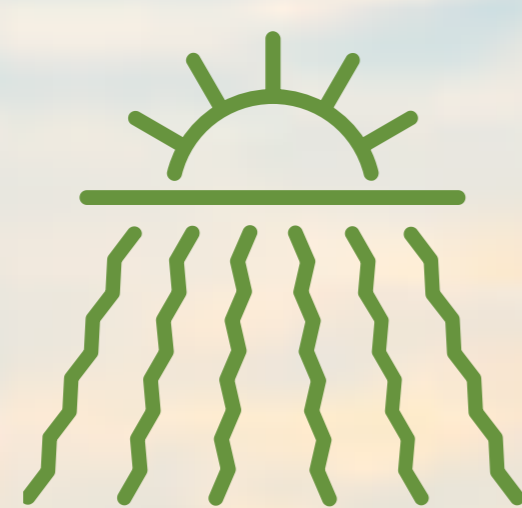

Suppressing aphids in canola using CanolaCap®

Our capsule range
